**(54) METHOD OF CLADDING FOR VALVE SATE
IN CYLINDER HEAD**

(57) Abstract:

PURPOSE: To prevent generation of flaws such as underfill, attenuation of base material and cracks.

CONSTITUTION: A waste thickness part 7, 8 continuous to a seat surface 2a is projectingly formed preliminarily, on both ends in the groove width direction of a seat surface 2a which is in the shape of a groove with a circular-arc cross section. Consequently, the holding capacity of a powder 5 is increased on the seat surface 2a, and heat capacity is also increased at both ends in the groove width direction of the seat surface 2a. After a cladding layer 6 is formed, cutting is performed so that the valve seat 2 is finished into the final machined

shape 2b with the extra thickness part 7, 8 cut and removed simultaneously.
